

# **SupreDye<sup>™</sup> XT Purification Kit User Manual**

#### Sequencing workflow

Perform cycle sequencing with SupreDye XT Purification Kit

## STEP 1: Add SupreDye XT Purification Reagents

#### **Overview**

The SupreDye XT Purification Kit sequesters cycle-sequencing reaction components such as salt lons, unincorporated dye terminators, and dNTPs to prevent their co-injection with dye-labeled extension products into a CE DNA analyzer. The SupreDye XT Purification reagents can be pipette separately and sequentially into reaction plate, or premixed together before being pipette into a reaction plate.

### **Ordering Information**

Refer to the SupreDye XT Purification Kit Protocol for recommended vortexers and required accessories.

|          | Approximate                  | Volume of Each |          |             |  |
|----------|------------------------------|----------------|----------|-------------|--|
| Kit Size | Number of 20-µL<br>Reactions | Resin          | Solution | Part Number |  |
| 2-mL     | 100                          | 2              | 9        | 160001      |  |
| 20-mL    | 1000                         | 20             | 90       | 160010      |  |
| 50-mL    | 2500                         | 50             | 225      | 160025      |  |
| 800-mL   | 40000                        | 800            | 3600     | 160400      |  |

#### **Important Tips**

- When you pipette directly from the Solution bottle:
  - Before pipetting, mix the Solution until homogeneous,
  - Use wide-bore pipette tips,
  - Avoid pipetting near the surface of the liquid,
  - When you seal the reaction plate, verify that each well is sealed.
- To achieve optimum performance, use a recommended vortexer and follow the protocol when you vortex the reaction plate.
- When you load plates into the CE instrument:
  - Do not heat-denature or use Formamide with samples containing SupreDye XT Purification reagents.
  - Use the ABI run modules specified for your instrument and plate type.

#### **Procedure for Sequential Pipetting**

| STEP |  | ACTION  |      |  |  |  |  |
|------|--|---|------|--|--|--|--|
| 1    | Centrifuge<br>the<br>sequencing<br>reaction<br>plates. | Follow the cycle-sequencing protocol. When the reaction is complete, centrifuge the reaction plate for 1 minute to spin down plate contents.<br><b>IMPORTANT!</b> You may need to decrease the amount of DNA template in the sequencing reactions to compensate for increased signal strength. See "DNA Quantity Guidelines" on page 6. |      |  |  |  |  |
| 2    | Add the<br>Solution to<br>the reaction<br>plates       | To each well of the reaction plate, add the volume of the Solution specified below, using a conventional pipette tip.<br>Make sure there are no particulates in the Solution before pipetting. If particulates are present, heat the Solution to 37°C and mix to redissolve. Cool to room temperature before using.                     |      |  |  |  |  |
|      |  | Plate Type and Reaction         Volume of the Solution/Well (μL)  |      |  |  |  |  |
|      |  | 384-well, 5 μL  | 22.5 |  |  |  |  |
|      |  | 96-well, 10 μL  | 45.0 |  |  |  |  |
|      |  | 96-well, 20 μL 90.0   |      |  |  |  |  |
|      |  | <b>IMPORTANT!</b> For 384-well reactions with reaction volumes less than 5 $\mu$ L, add water to bring the volumes to 5 $\mu$ L before adding the Solution. For 96-well reactions with reaction volumes less than 10 $\mu$ L, add water to bring the volume to 10 $\mu$ L before adding the solution.                                   |      |  |  |  |  |

| STEP |                | ACTION   |   |  |  |  |  |  |
|------|----------------|----------|---|--|--|--|--|--|
|      | Add the Resin  | Add the  | Resin:  |  |  |  |  |  |
| 3    | to the         | a.       | a. Vortex the resin at maximum speed for at least 10 seconds, until it is |  |  |  |  |  |
|      | reaction       |          | homogeneous   |  |  |  |  |  |

### **DNA Quantity Guidelines**

DNA sequencing reactions purified with the SupreDye XT Purification Kit result in high signal strength when analyzed on a DNA sequencer. Therefore, when you prepare sequencing samples for purification with the SupreDye XT Purification reagents, you may need to decrease the amount of DNA template in the sequencing reactions to keep the fluorescence signals on scale during analysis. Use the following table as a guide to the amount of template DNA for the initial cycle sequencing. Page | 6 of 7 v1.0

**IMPORTANT!** If you decrease the template concentration, also decrease the amount of any template controls proportionately. For example, if you run a pGEM control, dilute if 1:2 or 1:4 and add only 1 to 2  $\mu$ L.

| Template Type   | DNA Quantity/Reaction<br>(ng) |  | Template Type           | DNA Quantity/Reaction<br>(ng) |  |
|-----------------|-------------------------------|--|-------------------------|-------------------------------|--|
| PCR products    |                               |  | Other types of template |                               |  |
| 100 to 200 bp   | 0.5 to 3                      |  | Single-stranded DNA     | 10 to 50                      |  |
| 200 to 500 bp   | 1 to 10                       |  | Double-stranded DNA     | 50 to 300                     |  |
| 500 to 1000 bp  | 2 to 20                       |  | Cosmid or BAC DNA       | 200 to 1,000                  |  |
| 1000 to 5000 bp | 5 to 40                       |  | Bacterial genomic DNA   | 1,000 to 3,000                |  |
